GET CITED, NOT JUST RANKED

AI visibility snapshot

example.com

VS-2026-RS7CKU · 2026-10-28

1/5 Most of what we check is missing. Machines can barely reach this site, let alone describe it.

WHAT WE CHECKED

CHECK	STATUS	WHAT WE SAW
AI crawlers can read the site	Pass	robots.txt lets GPTBot, OAI-SearchBot, ClaudeBot, PerplexityBot, Google-Extended in.
llms.txt published	Partly	No /llms.txt. It is an emerging convention, cheap to add, and not yet decisive.
Structured data on the home page	Missing	No JSON-LD found. Machines have to guess what your company is.
Content readable without JavaScript	Missing	Only about 24 words in the raw HTML. Crawlers that do not run JavaScript see a near-empty page.
Title and description	Partly	Missing a meta description.

FIX THESE FIRST

01 Describe the company in JSON-LD

HIGH IMPACT · ABOUT 1–2 HOURS

Without an Organization entity, an engine has to infer who operates the site from prose. Entity data is what lets it connect your name, domain and profiles.

Add a JSON-LD block on the home page with @type Organization, name, url, logo, description and sameAs pointing at your real profiles.

02 Server-render the main copy

HIGH IMPACT · ABOUT HALF A DAY

Crawlers that do not execute JavaScript see an almost empty document. Everything a buyer should be able to find you for has to be in the HTML that the server returns.

Move the headline, service description and pricing copy into the server-rendered output. Keep interactive extras as progressive enhancement.

03 Publish /llms.txt

MEDIUM IMPACT · ABOUT 1 HOUR

A plain-text summary of who you are, what you sell and where the canonical pages live. It is an emerging convention, but it is cheap and it removes guesswork.

Serve a text/plain file at /llms.txt with the company name, a one-paragraph description, and a short list of key URLs with one line each.

04 Fix the title and description

MEDIUM IMPACT · ABOUT 30 MINUTES

These are the two fields most often reused verbatim when an engine summarises a page. Missing ones get filled in with whatever text it finds first.

One descriptive <title> per page, one meta description per page, both specific to the page rather than the brand slogan.

SCOPE

This report is generated automatically from the public pages of example.com on 2026-10-28. It checks the technical layer only: crawler access, llms.txt, structured data, server-rendered text, and page metadata. It does not measure whether ChatGPT, Perplexity or AI Overviews mention or cite you, and no human reviewed the site before it was sent. The citation baseline is a separate step, run over a fixed set of buying-intent questions.

Findings describe the state of the site on the date above, not a forecast. Nothing here guarantees a ranking, a mention or a citation.
